

100 Days SQL Journey - Day 03

Today's Topic: Selecting Specific Columns

Message: Every query you write sharpens your thinking. Keep going—you are improving one step at a time!

Quick Revision

Instead of selecting all columns with *, choose only the columns you need.

Example: `SELECT first_name, last_name FROM employees;`

- Mission 1: Display only the `first_name` column from `employees`. (Hint: Don't use *)
- Mission 2: Display `department_name` from `departments`.
- Mission 3: Display `product_name` and `price` from `products`.
- Mission 4: Display `customer_name` and `city` from `customers`.
- Mission 5: Display `employee_id`, `first_name` and `salary` from `employees`.

Bonus: Display `order_id`, `customer_id` and `order_date` from `orders`.

SQL Tip: Select only required columns to improve readability.

Tomorrow: Learn how `LIMIT` and `DISTINCT` work together!
