

■ 100 Days SQL Journey

Day 23

■ Today's Topic

Sorting data using multiple columns with **ORDER BY**.

■ A Little Message for Today

Sometimes one sort isn't enough. Learning to sort by multiple columns helps you organize data the way real businesses do.

■ Quick Revision

You can sort by more than one column. SQL sorts by the first column, then uses the next column when values are the same.

```
SELECT first_name, last_name FROM employees ORDER BY first_name,  
last_name;
```

■ Today's SQL Missions

- Mission 1 (Very Easy): Display employees sorted by `first_name` and then `last_name` in ascending order.
- Mission 2 (Easy): Display products sorted by category and then `product_name`.
- Mission 3 (Easy+): Display customers sorted by city and then `customer_name`.
- Mission 4 (Medium): Display orders sorted by `customer_id` and then `order_date`.
- Mission 5 (Challenge): Display employees sorted by `department_id` and then `first_name`.

■ Bonus Challenge

Choose any table and sort it using two columns, with one ascending and one descending if your database supports it.

■ SQL Tip of the Day

List the most important sorting column first because SQL applies it before the others.

■ Tomorrow's Preview

Tomorrow you'll begin searching for text patterns using **LIKE**.

■ Bonus Challenge

■ Closing Note

You're learning to present data in meaningful ways. Keep practicing, and every query will become clearer and more powerful.
